

DAOcreator Updates

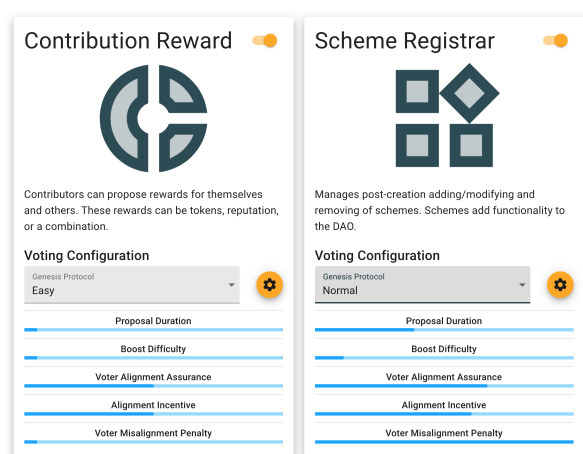

Background

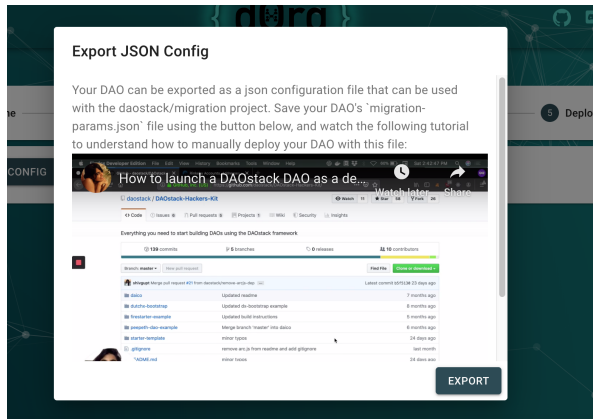

Earlier this year, dOrg released a basic U.I. for launching DAOstack DAOs. In August we released a second version with improved U.I. flow– including the ability to use preset voting machines and import founder list from CSV.

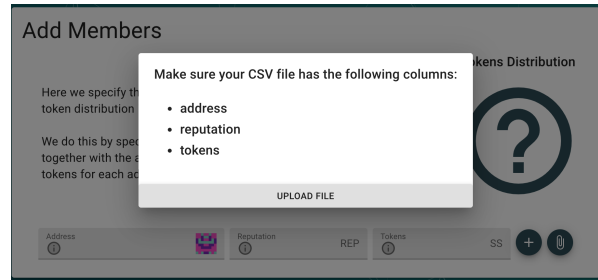

Parameter explainer pop-ups

Preset voting machines

Export the DAO's JSON configuration

Import from CSV

Deliverables

This proposal is to fund the next release, which will include the following new functionality:

- **Mainnet Deployments.** User can deploy the DAO with their web3 provider from inside the dapp.
- **Automated Alchemy Support.** User can access their DAOs in Alchemy right away, without communicating with the DAOstack team.
- **U.I. Improvements.** General improvements and bug fixes, such as CSV template download and sliding bars for parameters.

The new release will be made within 1 month of this proposal passing (~ early October).
